

NEWSLETTER OF THE TI PROGRAMMABLE CALCULATOR CLUB P.O. Box 1421, Largo, FL 34294

Volume 11, Number 3

Third Quarter 1986

The TI-95 arrives - see page 14.

This approximate, full-size illustration was extracted from page iv of the <u>TI-95 User's Guide</u>. The key nomenclature is shown, but some of the second and third functions are not shown. The alphabet functions of the keys, not shown here, are pseudo-QWERTY, where the keys are not staggered from row to row. One exciting feature of the TI-95 is the group of "windows" immediately above the F1 to F5 function keys. User determined prompts can be provided for the function keys. The prompts shown here are for the statistics program on page 22.

The newsletter is not copyrighted and may be reproduced for personal use. When material is used elsewhere we ask as a matter of courtesy that TI PPC Notes be mentioned. The use of material in this newsletter is entirely at the user's risk. No responsibility as to the accuracy and the consequence due to the lack of it will be borne by either the club or the editor.

ERRATA:

Combinatorial Analysis with Hex Codes on the TI-66 - V11N2P23

David Douglas, the author of this program, notes that there were typographical errors in the lists of keystrokes used to implant the hex codes: (1) the omission of the square root sign over the x before the equals sign in each line, and (2) STO 55 instead of STO 56 as the last step of the second line. The correct instructions are reproduced below:

Keystrokes	Hexcode	In Display
1 EE 50 / EE . 8 +/- 1 +/- \sqrt{x} = STO 63 STO 60 STO 57	OD (13)	1. 0-
1 EE 50 / EE . 6 +/- 1 +/- \sqrt{x} = STO 62 STO 59 STO 56	OE (14)	1. Or
1 EE 50 / EE . 4 +/- 1 +/- \sqrt{x} = STO 61 STO 58 STO 55	OF (15)	1. 0

More Subprograms in the Statistics Module - Line 40 in the program to demonstrate the IC subprogram call near the bottom of V11N2P21 should should read

40 CALL IC(A,B,N,Q)

Many Digits of Ln(3) - V11N2P25. The instructions for modifying the program on the preceding page to find Ln(3) instead of Ln(2) noted that line 160 should be changed to 9999999999 (ten nines) but failed to note that (1) the 2 in line 120 should be changed to a 3, and (2) the 9's in lines 620 and 630 should be changed to 4's.

Robert Prins writes that he has now completed an extended precision calculation of ln(3). He confirms that the first 998 digits on V11N2P25 are correct, but finds that the last two digits should be 23 not 43.

USED TI-59 MATERIAL - John Walker offers the following hardware and other TI-59 related material for sale:
TI-59 (\$50.00), PC100C (\$100.00), Applied Statistics Module (\$20.00), and Math/Utilities Module (\$20.00). He also has two boxes of magnetic cards and a manual CROM selector by American Microproducts which can be installed in the printer cradle. Books include four specialty pakettes (Printer Utility, Quality Assurance I, Quality Assurance II, and Statistical Testing), Engineering Statistics by William Volk, Statistics X Calculator by Peter Zehna, Calculator Clout by Maurice Weir, and Probability by Calculator by Peter Zehna. Make an offer.

He will sell the complete package for \$190.00. Write to: John E. Walker, c/o Williams Industries, 2201 East Michigan Road, P.O. Box 212, Shelbyville, IN 46176.

USE OF THE AC-9201 WITH THE TI-74 AND PC-324 - V11N2P17 noted that the Educalc catalog listed the AC-9201 as TI-74 hardware, but that my TI-74 did not have an adapter socket. A statement on page 5 of the manual for the PC-324 provides an explanation:

"You can use the optional AC9201 adapter to operate the printer on standard line voltage. When connected to the printer, the adapter provides power for both the printer and the calculator."

Tests also show that a TI-74 without batteries will run when connected to a PC-324 with batteries.

If you remove the batteries from a standalone TI-74 for about a minute, and then reinstall them you will receive the message "W30 Initialized" at turnon. Among other things, that message means that you lost any programs which may have been in memory. Page 1-5 of the TI-74 User's Guide warns against that condition with the statement:

"The Constant Memory (TM) feature retains stored information for a short time after the batteries are removed. As a precaution, however, you may want to save any important programs and data on a storage device (such as a cassette) before replacing batteries."

The availability of power for the TI-74 through the printer connection, whether from the batteries in the printer or the AC-9201, allows the user to circumvent the potential problem of loss of memory when changing batteries in the TI-74. All you need to do is have the printer connected, with batteries installed or the AC-9201 connected, during the battery change in the TI-74.

DEVICE CODE FOR THE PC-324 - The instructions for accessing the printer which appear in the manuals for the Statistics and Mathematics cartridges for the TI-74 state that you can find the identification number (device code) in the printer operating manual. I couldn't find the number in the manual for the PC-324. I experimented and found that the number 12 would work. Later, I found that page 3-19 of the TI-74 Programming Reference Guide indicates that the device code for the printer is indeed 12.

DISCUSSION OF THE TI-59 FIRMWARE - Page 7 of this issue discusses the firmware mechanization of the DMS function in the TI-59. Newcomers who are interested in more details on the firmware in the TI-59 should send four dollars for a twenty page discussion on subjects such as how to view the firmware from the keyboard, the mechanizations for all of the statistics and conversions functions, the HIR 20 function, and identification of the constants used in the log and trig functions.

TI- 74 AVAILABILITY - TI-74's became available at the local Service Merchandise outlets in October 1986. Only the computer was available at a price of \$99.97 plus tax. No peripherals so far.

Extra-precision Combinations on the TI-59 - L. Leeds. V11N1P4 compared the results from various devices for permutations and combinations. A method of calculating combinations was demonstrated which avoids the generation of non-integer values for combinations. In this program Laurance Leeds provides a fast mode program which has an option for the exact calculation of combinations of up to 37 digits.

User Instructions:

- 1. Enter N, press A.
- 2. Enter R, press B.
- 3. Press C and see a flashing "1. 12" in the display. Press 7 and then EE. The calculator stops with a thirteen digit solution in the display.
- 4. Look at the exponent of the answer. If it is less than 38 an extended precison answer can be obtained by pressing D. The calculator will stop with a flashing "1. 12" in the display. Press 7 and then EE and wait for completion of the solution indicated by display of a zero. Press E followed by as many R/S's as needed to display the anwawer. The output contains nine digits per display. Add leading zeroes to any number less than 9 digits. A display of 0.3333333333 indicates the end of the answer.

Extra-precision Combinations on the TI-59 - (cont)

Steps 5 through 29 provide for initialization and data entry. The GTO 472 at 031-033 picks a jump address for fast mode entry at step 001 for the 13 digit calculation. Steps 60 to 100 are the 13 digit calculation which determines if the answer is less than 38 digits long. The GTO 469 at 036-038 picks up a different jump address

8*(WXY) + Z + 1 = 8*12 + 4 + 1 = 101

where W through Z are the ninth through twelfth digits. Steps 101 through 248 are the extra-precision calculation. Steps 39 through 59 display the result of the precision calculation.

For N = 100 and R = 70 the 13 digit answer 2.937234e25 will be returned in about 13 seconds. The extra precision solution requires about 340 seconds, and is read out by Mode E as 0 0 29372339 821610944 823963760.

EXTRA-PRECISION COMBINATIONS IN BASIC - L. Leeds

Larry also provided a Model 100 BASIC language equivalent of the TI-59 program on the preceding page. The program at the right is the editor's conversion for use on the CC-40 or TI-74.

Line 110 presumes that a software module is installed so that the UP subprogram can be used to print a title, set a branching value (PN) to select use of a printer or the display for output, and open a file for access to the printer if needed.

Use of the ten digit IMAGE definition at line 120 provides right justification of the output for the extra-precision answer.

Lines 150 through 195 are the single-precision solution.

Lines 200 through 360 are the extended-precison solution.

Lines 370 through 410 provide output of the extra-precision solution.

The program capability is 41 digits. The printout illustrates the solution for two problems. The printout and listing were made with a CC-40/HX-1000 combination in the 36 character per line mode and magnified for readability.

A listing and printout using a TI-74 with a PC-324 appears on page 18. That program also illustrates the mechanization of an option between output to the printer or to the display with out using the Call UP idea.

```
188 W=1.E+18
118 CALL UPC"nCt = NE/CRE(N-R)E)",PN

LOAN SCHEDULE WITH THE FINANCE MODULE OF THE CC-40

Earlier issues have presented programs for loan achedules for the TI-59; for example, see V9N1P2O and V11N2P14. V10N1P9 also presented a loan achedule for the CC-40 used with the RS-232 interface and a full size printer. During search of the Finance module of the CC-40 for non-published subprograms I found that the Money Evaluator program can print out a loan schedule as well. A sample printer output appears at the right. To obtain this printout install the Finance module in the CC-40, connect the HX-1000 Printer/Plotter, enter RUN "MEVAL" in the display and press ENTER. The following sequence shows the displayed prompts followed by the responses in brackets:

- 1. Use Printer? <y>
- Enter Device Name: <10.s=0>. The 36 character per line printer option is selected and the heading "MONEY EVALUATOR" is printed.
- Nominal Interest? <y>. The heading "Nominal Interest is printed.
- 4. Enter Compounding Prds/Yr: <12> . The prompt and entry are printed.
- 5. Enter # Pmts/Yr: <12> . The prompt and entry are printed, followed by a menu of options.
- 6. Enter Compute Option: <1>, where we select the Payment option (1) to calculate the payment per period.
- 7. Enter # Payments: <9>. With Matteson's TI-59 program on V11N2P14 we had used 0.75 years. "# Payments= 9" is printed.
- 8. Enter %Interest: <12.5> , and "%Interest= 12.5" is printed.
- 9. Enter Pres Val: <1000> , and "Pres Val= 1000" is printed.
- 10. Enter Future Val: <0> , and "Future Val= 0" is printed.
- 11. End of Period Payments: <y>, and the prompt is printed. If the user response had been <n> then the prompt "Beginning of Period Payments" would have been displayed to permit use of an alternative method of payments.
- 12. Discount Backward? <y>, and the prompt is printed. I don't really understand this; perhaps some member with more background in accounting can enlighten me.
- 13. Edit? <n>, where if we had answered <y> we would have an opportunity to check and change if we desired all the responses since the menu. Since we had selected Option 1, the monthly payment of \$116.98 is calculated and printed.
- 14. Amortize? <y> , and the message "Annual Debt Payment= 1403.76" is printed. That is the monthly payment multiplied by 12, which has very little to do with our nine month problem, but I don't know how to suppress it.
- 15. Subtotals? <n> , where the lower example at the right shows a printout for a response of <y>.
- 16. Cumulative Totals? <n> .
- 17. Enter First Payment #: <1> .
- 18. Enter Last Payment #: <9> , and the schedule is printed as shown at the right.

Loan Schedule with the Finance Module of the CC-40 - (cont)

In step 2 it was necessary to respond with <10.a=0> to obtain the 36 character per line printer option and get the nicely formatted printout shown on page 6. If the simpler response <10> is used the default condition of this program sets the 18 character per line printer option. The printout at the right illustrates the effect of the 18 character option on the printout. Clearly, the programmer of the Money Evaluator assumed the 36 character per line option, but failed to provide for it as a default option.

A different condition applies with the Prime Factors program (RUN "PRI") in the Mathematics module as discussed in V8N4P12. There the 36 character printer option is selected by the program, a the response to the prompt "Enter Device Name:" of <10.s=1> does not change the printer to the 36 character per line mode.

Similarly, the UP subprogram in the various modules will set the printer to the 36 character per line option whether or not you add the s=0 part to the device name.

THE USE OF DMS TO TRUNCATE THE DISPLAY REGISTER TO THE DISPLAY - P. Hanson. Step 4 of

the instructions for the loan schedule program on V11N2P14 noted that fractional years could be entered. An example was given using 0.75 years. It is not surprising that when the program multiplies that value by 12 to yield the number of months that the answer is acceptable. But what about other fractions. If you wanted seven months you might enter 7 divided by 12. When the program multiplies that result by 12 the display is "7.", but the display register contains 7 - 1e-12. The use of an integer function as at step 336 on V11N2P15 will yield 6 instead of the desired 7. An EE-INV-EE sequence before the integer function would place the display value in the display register as noted on page C-1 of Personal Programming, but examination of the program doesn't reveal such a sequence. The equivalent result is obtained with the DMS at step 323, where page V-30 of Personal Programming notes that the DMS conversion acts only on the displayed value.

We know that the DMS function is mechanized as shown at the right. The curious feature of the mechanization is that the truncation to the diaplay feature of the DMS function is cannot be determined from the listing. There is no EE-INV-EE sequence to be found. If you place 7 - 1e-12 ($7 / 12 \times 12 =$) in the display register and run the routine at the right from user memory the displayed answer will be 7.677777778 which is derived as follows:

6. degrees converts to 6.

99 minutes converts to 1.65

99 seconds converts to .0275

.99999999 seconds converts to .000277777775

which sums to 7.6777777778

for a display of 7.77777778

FINAL VALUE OF AN EXPONENTIAL PROCESS - Page 98 of the July 19, 1986 issue of Machine Design presents an HP-15 program which allows the user to predict the final temperature of a system in a steady state thermal environment. The author, Michael Kugelman, starts with the well-known equation

$$T = (T_f - T_O)(1 - e^{-At}) + T_O$$

where T = the temperature at any time, t = time, T_0 = initial temperature, T_f = final temperature, and A = the reciprocal of the thermal time constant for the system. Kugelman then derives the following equation for the final temperature as a function of two temperature measurements performed early in the process:

$$(T_f - T_o) \left[1 - \left(\frac{T_f - T_1}{T_f - T_o} \right)^{t_2/t_1} \right] - (T_0 - T_0) = 0$$

where T_1 = the temperature at time t_1 and T_2 = the temperature at time t_2 . The author gives a program for determining T_f using the SOLVE function of the HP-15C. The solution can also be obtained using the Zeroes of Functions program in the Master Library module of the TI-59. The program below provides a solution, including annotation of the input and output values when using the PC-100.

User Instructions:

- 1. Enter To and press A.
- 2. Enter T1 and press B.
- 3. Enter T2 and press C.
- 4. Enter t1 and press D.
- 5. Enter to and press E.
- 6. Enter the lower limit and press 2nd B'.
- 7. Enter the upper limit and press 2nd C'.
- 8. Press 2nd D' to solve. The printouts at the right are for the sample problem in the article in Machine Design. Note that the printout uses D's to indicate temperatures and T's to indicate time.

Final Value of an Exponential Process - (cont)

The "1" at step 093 of the program sets the maximum error at 1 degree. With that setting, and starting the solution with the lower limit at 200 degrees and the upper limit at 400 degrees, the program yields the first solution, 299.609375, in about 40 seconds. If the maximum error is set at 0.1 the execution time time is extended to about 55 seconds to yield the second solution of 299.9511719. If the maximum error is set at 0.01 with the TI-59 program the solution 299.9786377 is obtained in about 70 seconds. The HP-15C, where it is not necessary to enter a maximum error when using the SOLVE mode, obtains the solution 299.98 in 19 seconds. We will see that a maximum error setting of 1 degree will be adequate unless the temperature and time measurements are very accurate.

Analysis of accuracy:

The input temperatures defined for the sample problem in Machine Design were listed to two decimal places, 51.17 °C at 3 minutes and 89.37 °C at 8 minutes. I wondered at that level of accuracy. The leadin to the sample problem states:

"A piece of electrical equipment operates at a current level that is expected to result in a final temperature of about 300 °C. Ambient temperature is 25 °C and the thermal time constant of the equipment is about 30 minutes."

If you enter those values into the first formula and solve for T at 3 and 8 minutes you will obtain values of 51.16971004 °C and 89.36970695 °C. Thus, the input values in the sample problem are within 0.0003 °C of those values. To examine the effect of errors in the input values on the estimate of the final value I reran the sample problem with variations in the input temperatures of either 0.1 or 0.5 °C, and variations in the input times of one and five seconds. The results are in the following tables.

Sensitivity to errors in temperature measurements (delta in °C):

	T - 0.5	T - 0.1	T + 0.1	T + 0.5
To	271.5	293.4	306.6	339.5
T ₁	377.7	312.1	288.7	252.7
T ₂	276.2	294.9	305.1	328.5

Sensitivity to errors in time measurements (delta in seconds):

	t - 5	t - 1	t + 1	t + 5
t ₁	239.5	284.8	317.6	420.7
t ₂	334.8	305.9	294.2	273.0

Thus, errors in the input temperatures of as little as 0.1 $^{\circ}$ C, or errors in the input times of as little as one second, can generate errors in the solution of 5 $^{\circ}$ C or more. Unless you can achieve at least those accuracies in measurement there is no need to use a maximum error smaller than 1 in the TI-59 solution.

Final Value of an Exponential Process - (cont)

Solution on the Casio fx-7000G

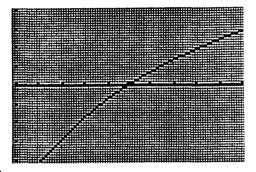

This sort of problem can be solved very nicely using the Graph, Trace, Factor and Range functions on the fx-7000G. Enter the program shown at the right, say in the Program O location. Then, to run the sample problem from Machine Design:

 Press Range and enter the following values:

Xmin:200	Ymin:-2
max:400	max:2
sc1:20	ac1:0.5

- 2. Press Prog O EXE and see "1=INPUT?" in the display. To enter the temperatures and times press 1 EXE, and see the prompt "TO?" in the display. Enter the value for To (25 for the sample problem), press EXE, and see the prompt "T1?". Continue to respond to the prompts. When EXE is pressed after entering the value for to in response to the prompt "TIME2?" the plot of the function will be generated in about fifteen second. For the sample problem the plot will look like the upper figure at the right.
- 3. Press SHIFT Trace, and then press the right arrow until the flashing cursor is at the intersection of the plot and the x axis. The displayed x value nearest to that condition is the solution for T_f. (Note that the flashing cursor moves along the x axis, not along the function curve. That is due to the Graph Y = 0 at line 11 of the program. If you would rather have the cursor move along the function curve, simply eliminate line 11.) For the sample problem the values 300 and 302.1276596 seem to bracket the solution.

Cls:0+F 2 "1 = INPUT" ?+F 3 F=O⇒Goto 2 "TO"?+A 4 5 "T1"?+B 6 "T2"?-C 7 "TIME1"?+D "TIME2"?+E 8 9 Lbl 2 10 Graph Y = (X-A)(1- $((X-B)\div(X-A))\times^{Y}($ E + D)) - C + A Graph Y=0 11

- 4. Expand the plot in the neighborhood of the solution to obtain increased resolution of the value for T_f. Place the flashing cursor near the intersection at one of the bracketing values, press SHIFT Factor, and see the prompt "Factor". Enter the factor, or factors, by which you wish to expand the plot and press EXE. Then, press Prog O EXE and see the prompt "1=INPUT?". Respond with O EXE to skip the data entry steps. A new plot will appear. For the sample problem, and a response to "Factor" of 100 the new display will look like the lower figure at the right.
- 5. Go to step 3 above to read out the solution. For the sample problem and a factor of 100 the best solution seems to be 299.9787234. Repeat steps 3, 4, and 5 as many times as necessary to obtain the desired readout resolution.

YEARLY LOAN SCHEDULE - Hewlett Ladd. V9N1P20 and V11N2P24 presented earlier loan schedules for the TI-59 and PC-100. Those programs are time -consuming since they print monthly schedules with year-end summaries, while many users are only interested in the annual summaries. Hewlett's program prints only the annual summaries to yield a substantial savings in execution time and in printer paper. His program also provides a worksheet mode to permit examination of the effect of alternative loan parameters. A sample printout appears at the right. The Master Library module must be installed.

User Instructions:

- 1. Enter the date of the loan as YYYY.MM for the year and the month and press 2nd A'. The heading "LOAN TABLE DATA" and the year and month with the annotation "DATE" are printed. The display shows the year and month. The program assumes that the first monthly payment becomes due in the ensuing month.
- 2. Enter the remaining loan factors in sequence with an R/S:
- (a) Amount of loan. The amount is printed with the annotation "AM'T". The display shows "0.00."
- (b) Balloon payment. If not applicable do not skip this step, but press R/S. The balloon payment is printed with the annotation "B/PM". The display shows "4045653536".
- (c) Number of years of the loan. Enter fractional years as a decimal to the nearest quarter. The years are printed with the annotation "Y'RS". The display shows "4061336313".
- (d) Annual interest rate in per cent. The rate is printed with the annotation "%P/A". The program continues with the calculations and prints the following parameters:

P/MO - Monthly payment.

PMTS - Total monthly payments.

+BLN - Additional payment due at end of term

INT - Total interest for term.

and ends the table with a line of asterisks. The display shows "0.00".

3. To print the annual loan schedule press 2nd B'. The heading "ANNUAL RESULTS" and the loan date and amount are printed, followed by annual summaries which include the date (YYYY.12), the payment on principal for the year (annotation "P-PD"), the interest payments for the year (annotation "I-PD"), and the balance at the end of the year (annotation "BAL"). The final year's payments are identified as YYYY.MM where MM will be the month in which the final payment is due. This year will normally end with a zero balance, unless a balloon payment applies when that amount will be shown as the final balance. The schedule ends with a line of asterisks. Printout of a five year schedule takes about 32 seconds.

Yearly Loan Schedule - (cont)

- 4. Worksheet with a tentative loan schedule entered you may use this routine to test the effect of alternative loan factors before running a final table. Enter the factor to be changed and press the appropriate key to see the effect. The keys and the instructions for their use are:
 - D' To print the worksheet heading.
 - A To change the principal and find a new payment
 - B To change the balloon payment and find a new payment.
 - C To change the term and find a new payament.
 - D To change the interest rate and find a new payment.
 - E To change the payment and find a new term.
 - E' To print a concluding line of asterisks.

You may continue to test changes in this way unitly ou have attained your desired goal. To erase a previously entered balloon payment enter a zero and press B. Remember to return to steps 2 and 3 with your final data before attempting to print the loan schedule.

You may use the worksheet program after a loan schedule has been printed, but your first entry must be a new principal since the previous starting value for the principal will have been changed to the balance at the beginning of the final year.

TI-95 AVAILABILITY - Page 57 of Issue #33 of the EduCALC catalog describes the the TI-74 BASICALC and the TI-95 PROCALC. The following prices are listed for the TI-95 and its peripherals:

TI-95	Procalc	\$149.95
95-771	Math Cartridge	39.95
95-772	Statistics Cartridge	39.95
TI-695	8K RAM Cartridge (Also used with the TI-74)	39.95
PC-324	Portable Printer (Also used with the TI-74)	89.95
CI-7	Cassette Interface (Used with the TI-74)	26.95

You can order with a credit card by calling (714)-582-2637.

THE TI-95 - Palmer Hanson. In early December the TI-95 became available from Educalc. The price list appears at the bottom of page 13 of this issue. Members report that the TI-95 is also available from Elek-Tek, but I have not yet received a catalog. You can call Elek-Tek toll-free at 800-621-1269 and order by credit card if you like. There is a shipping charge of \$4.00 for the first item and an additional \$1.00 for each additional item. The TI-95 has not yet appeared on the shelves of local stores.

A full size illustration of the TI-95 appears on the front page. At first glance it looks a lot like the TI-74, and it is. The TI-95 will fit in the carrying case for the TI-74 and vice versa. Both devices work with the PC-324 printer, the CI-7 Cassette Interface, and the 8K RAM cartridge, but there the similarity ends. The Educalc catalog calls the TI-74 a BASIC-language programmable calculator, and V11N2P4 noted that the operation is very similar to the CC-40. The Educalc catalog describes the TI-95 as TI's top-of-the-line scientific programmable which now includes "menu windows". We will see that the TI-95 has many features similar to the TI-59, but that it also has some commonality in command structure with the TI-57, the TI-55II, and the TI-57LCD.

The menu windows and the associated function keys directly below the menu windows provide a major extension in flexibility. As an example consider the operation of the NUM key. When the key is pressed, the legends INT, FRC, R#, RND, and --> appear in the windows above the function keys F1 through F5. Pressing one of the function keys results in the following response:

- F1 INT The integer function is performed on the value in the display register.
- F2 FRC The fraction function (INV INT on the TI-59) is performed on the value in the display register.
- F3 R# A pseudo-random number between O and 1 is placed in the display register.
- F4 RND The mantissa of the number in the display register is rounded to the mantissa of the number in the display (the equivalent of the EE-INV-EE sequence on the TI-59).
- F5 --> A new set of legends appears in the menu windows: SGN, LCM, PF, ABS and -->. Pressing one of the function keys now yields a different response:
- F1 SGN The signum function is performed on the number in the display register (the Op 10 function in the TI-59).
- F2 LCM The lowest common multiple for a pair of numbers in the t and display registers is returned to the display register.

 The lowest common factor is returned to the t register.
- F3 PF The lowest prime factor of the number in the display register is returned to the display register. The remaining factor is in the t register.
- F4 ABS Finds the absolute value of a number in the display register.
- F5 --> Returns to the original set of options.

The TI-95 - (cont)

Each of these functions can be used from the key-board or in a user program. A demonstration factor finder program which uses the PF function, and which will also illustrate other aspects of programming the TI-95 is listed at the right together with some sample solutions. Note that the LIST function prints more than one keystroke on each line; old-timers will recall that programs were listed in a similar manner in 52 Notes.

Line 0000 - The value to be factored is printed, stored temporarily in the t register, and a one is stored in data register A. In the TI-95 the first 26 data registers (000 through 025) can also be identified by the letters A through Z.

Line 0006 - All labels consist of two alphanumeric characters, and require three program steps. You can use a space for one of the characters, but the program assembly still assigns three steps to the label. The PRT at step 0009 prints the factors, or displays them if the PC-324 printer is not connected. The PRT ' PAU sequence acts to provide a flashing display of each factor similar to that we are used to with the TI-59 and TI-66. Without the ' to clear the display it would not be possible to identify repeated factors from the display.

0000 ADV PRT x~t 1 STD A

Line 0012 - the xxt command brings the number to be factored to the display register. The PF command places the factor which was found in the display register and stores the remaining value in the t register. If the solution is complete, that is, the number being tested is prime, then a 1 appears in the display register. The INV IF= A compares the factor found with the value of 1 in data register A to determine if the solution is complete. Note that comparisons are not made against the contents of the t register, but may be made against the contents of any data register.

Line 0017 - GTL PF means goto label PF. We could have also used GTO 0009. The xwt brings the last prime factor to the display for printing.

The first two solutions are for benchmarks that we have used to evaluate factor finder programs. The second solution actually used an input of 111,111,111,111 and demonstrates that the PF algorithm can handle twelve digit inputs. The third solution is incorrect. The thirteen digit input value was 9,999,999,999,990 which is 90 times the input value for the second solution; therefore, we would expect to find the same factors, plus additional factors of 2, 3, 3 and 5. The erroneous solution is the result of the algorithm used in the factor finding, which probably tests whether the quotient of the input value divided by the factor being tested has a fractional part. Note that eleven, twelve, and thirteen digit values can be entered directly into the display.

The PF algorithm requires about 1 hour 45 minutes to declare that 999999967 is prime. That is about ten minutes less than reported for the CC-40 in V9N6P4.

BENCHMARK TESTS OF THE TI-95 - Palmer Hanson. I tested the TI-95 arithmetic with some of the same benchmarks which we have discussed in earlier issues. The results were better than the TI-59 in nearly every case.

- 1. e x n' was equal to n' x e indicating that multiplication was commutative. The non-commutative multiply on the TI-59 was discussed in V9N2P15.
- 2. $\sin(45)$ was equal to $\cos(45)$. Use of a short program showed that $\sin(X)$ was equal to $\cos(90 X)$ for 0.01 degree increments over at least the range from 0 to 90 degrees. For arguments less than one radian the value of the calculated sine was no more than 1e-13 from the rounded value from the tables in AMS 55. For arguments above one radian the accuracy was degraded, with errors as large as 4e-13.
- 3. The aquare root-squared test: V8N3P13/14 described this test which is a derivative of the $(\sqrt{2})^{\Sigma}$ test by Brian Hayes on page 136 of the January 1981 issue of BYTE. For our test we start with an integer, take the square root five times, take the square five times and compare the result to the original number. I tested selected integers from 2 through 17. The display returned the starting integer in each case. The actual values before truncation to the display were:

2	1.99999 99999 83	12	12.00000 00001 3
3	3.00000 00000 04	13	12.99999 99998 1
5	4.99999 99999 70	15	15.00000 00002 9
7	7.00000 00000 71	17	17.00000 00000 7

where all of the answers are better than those from the TI-59.

4. 1.0000001 squared 27 times: V9N2P11 described this test from the "Computer Recreations" column of the April 1984 issue of Scientific American, where there are different methods of calculation:

Exact	674530.47074 10845 59
Mode A (Repeated A^2)	674530.31804 26
Mode B (Repeated A*A)	674530.31804 26
Mode C (A^134217728)	674530.47074 01

All solutions are much better the answers from the TI-59. The Mode C solution is nearly identical to that from the TI-74 and TI-66, within 1 in the last place. In tests of other devices only the Model 100 and Casio fx-7000G yielded better answers for the Mode C solution from the TI-95.

5. The Bob Fruit Benchmark: Bob proposed a compound interest problem as another benchmark (see V8N4P4). The appropriate equation is that for the sum of a geometric series $S = [(1 + i)^n -1]/i$. An annual interest rate of ten per cent (i = .10/12) and compounding monthly for thirty years (n = 360) yields:

Exact 2260.48792 47960 86067 ... TI-95 using the y^x function 2260.48792 4513

where that answer is equivalent to that obtained with the TI-74 or TI-66, but not quite as good as from the TI-59.

Benchmark Tests of the TI-95 - (cont)

6. The "Itay-bit of Paranoia" test from the February 1985 issue of BYTE is another method for examining the internal arithmetic of a device. V10N2P18 presented a 383 step listing which would run on the TI-59. A "brute-force" conversion for the TI-95 required 470 steps, where the major portion of the increase was associated with use of three steps for

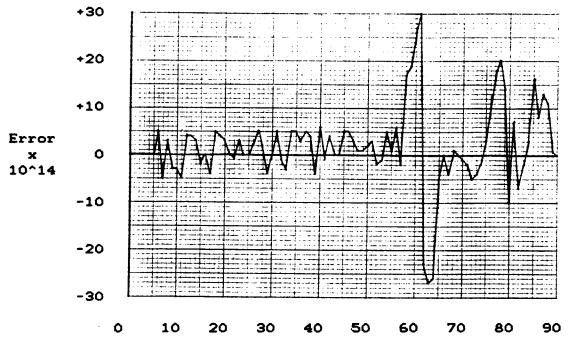

Radix	10.
Prec	13.
F≯w	1. 13
Ul Þ 1	113
Has G.D.	

a STO nnn or RCL nnn versus the two steps required for equivalent commands on the TI-59. The program lengths would have been very similar if I had used alphabetic addressing. The printout from the program appears at the right. The pleasant surprise is the existence of a guard digit. That can be verified by another test from the BYTE article, comparing the results from the two expressions:

 $1 - (9/27 \times 3) =$ and $1/2 - (9/27 \times 3) + 1/2 =$

The TI-95 yields 1.-13 for both expressions. The TI-59 and TI-66 yield 1.-12 for the first expression and 1.-13 for the second.

7. More on Accuracy of the sine function: The errors in the output of the sine function from the TI-95 are actually very similar to those from the TI-74. To illustrate the similarity I plotted the difference between the thirteen digit output of the TI-95 versus the fourteen digit values obtained from AMS 55:

Angle (degrees)

Note the similarity to the plot for errors in the sine function from the TI-74 on V11N2P6. For input angles less than one radian the error is never greater than 5e-14. These results are substantially better than those from the TI-59, the TI-66, or the CC-40, and are only slightly worse than those from the Radio Shack Model 100. The results are slightly worse than those from the TI-74, but only because the output is limited to thirteen digits, not fourteen digits.

EXTRA-PRECISION COMBINATIONS ON THE TI-74 & PC-324

Page 5 presented a conversion of a BASIC program by Larry Leeds for use with the CC-40. The program assumed that a software module was installed so that the UP subprogram could be used to print a title, to set a branching value to select use of either the printer or the display for output, and to open a file for access to the printer when needed. That program would also run on a TI-74 if one of the software modules was installed.

The program at the right does not assume that a software module is installed. Thus the functions which might have been provided by the UP subprogram must be provided in the user's program. The changes required are in lines 110 through 117 where:

Line 110 provides a prompt for selection of the printer or the display for output.

Line 113 processes the user response to set the PN flag as required.

Line 115 provides a prompt for entry of the device number if the printer option was selected. For the TI-74 operating with the PC-324 the user response is 12. For the CC-40 operating with the HX-1000 the response may be either a 10 or a 11 depending upon the setting of the switch in the HX-1000.

Line 117 opens a file for access to the printer if the printer option was selected.

The program listing was made using the normal printing mode of the PC-324, or 24 characters per line. Note the substantially improved legibility relative to the listing on page 5 which was made using the 36 character per line mode of the HX-1000 and then magnified.

Sample printouts appear below. Again, note the improved legibility over that on page 5.

ALPHA-NUMERIC INV LST - Hewlett Ladd found that the existing alphanumeric listing programs were painfully slow.

Lem Matteson's program from V7N6P5 takes about 47 seconds per line. The earlier Bill Skillman program from V5N3P11 required about 22 seconds per line in normal mode, or about 13 seconds per line when converted to fast mode. Hewlett's program as listed below requires only eight seconds per line. The user instructions are:

See a sample listing on page 13. For R01 through R89:

- 1. Load bank 1 below with banks 2, 3, and 4 of the data registers. 2. Enter the lowest register to be listed and press A.
- 3. Enter the highest register < 90 and press R/S. See a flashing "1." and press 7 and then EE to begin listing.

For R90 through R99:

- 1. Load banks 1 and 2 of the program and force the bank 1 with the data registers to be listed into bank 3.
- 2. Enter the lowest register to be listed > 89 and press B.
- 3. Enter the highest register < <00 and press R/S. See a flashing "1.12" and press 7 and then EE to begin listing.

COMBINATORIAL ANALYSIS ON THE TI-95 - Built-in functions are provided for factorials, permutations, and combinations. The solutions are relatively fast, but not as fast as with the TI-74. Some representative times are:

	TI-59 (ML-16)	TI-74	TI-95
69!	14 sec	<1 sec	1 sec
100p50	43 sec	1 sec	2 sec
328c164	165 s ec	3 sec	10 sec

The TI-95 does not seem to have the TI-59 ML-16 problem with non-integer solutions for combinations as described in V11N1P5; thus, 20c12 and 20c8 both yield the integer 12570. The TI-74 yields the non-integer value 12570.00000007 for both of those problems.

In the EE mode the TI-95 displays only a seven digit mantissa, while the TI-59 displays an eight digit mantissa and the TI-74 displays a ten digit mantissa. The 13d function of the TI-95 provides an easy method for viewing the entire mantissa.

RANDOM NUMBERS FROM THE TI-95 - The R# function provides a series of uniformly distributed pseudo-random numbers with values in the range from O to 1. A different sequence of values will be returned each time the routine is used. This is in contrast to the TI-74 and CC-40 where the RND function delivers the same sequence each time the computer is used. A method is provided for controlling the starting seed number so that a user can obtain a repeatable set of pseudo-random numbers if he so desires. Sorting the R# output into ten equal width buckets yields the following distributions for different quantities of numbers:

	1000	10,000	100,000	
R000	9 5	975	9,828	
R001	94	1044	10,096	0000 CMS STD 011
R002	102	1000	10,093	0004 LBL AA R# *10=
R003	100	961	9,993	0012 STD 010 INC IND 010
R004	107	1015	9,953	0019 DSZ 011 GTL AA
R005	104	1007	10,001	0025 LBL B RCL IND 011 0032 PRT INC 011 10 INV
R006	100	950	9,987	0032 FR THE BIT TO THE
R007	114	1030	9,985	GOOD IN COLUMN TO THE TO THE TO
ROOS	90	1023	9,941	
R009	94	995	10,113	

The tallying program at the right uses the indirect address sorting technique deswcribed in V10N1P4 and V10N3P13. Steps 0007 through 0014 rely in the characteristic of the TI-95 which selects the indirect address for a non-integer subscript by truncating to the integer value. That feature was also present in the TI-59 and TI-66. V11N2P7 noted that the CC-40 and TI-74 select the indirect address by rounding to the nearest integer. Line 0025 illustrates the use of a label where one character is a space.

ELEMENTARY STATISTICS ON THE TI-59 - Palmer Hanson.

Since this is one of the first programs I wrote for my TI-59 I thought it might be an appropriate program for comparing the capability of the TI-59 with the TI-95. The program assembles a list of input values in memory which can then be operated on to yield some of the elementary statistics. When used with a printer the program provides titles for the input and output, prints the input and output values, and provides annotation for the output. A sample printout appears at the right. The program listing appears below. User instructions follow.

- 1. Press A to initialize. The heading "INPUT" is printed.
- 2. Enter each input value and press R/S or 2nd A'. The input values will be printed. The calculator will stop with the number of items entered so far in the display.
- 3. To compute the statistics press B. The calculator wil stop with the number of input values in the display.
- 4. To print the statistics summary press C. The heading "STATISTICS" is printed followed by the annotated output values.
- 5. To add values to the list after modes B or C have been run, enter the first additional value and press 2nd-A'. The input value will be printed. You may use R/S to enter any further values.
- 6. To make corrections press 10 INV List to see each input value with the corresponding data register. Use STO nn to enter corrections.

ELEMENTARY STATISTICS ON THE TI-95 - P. Hanson

This program was written to provide a capability equivalent to that of the TI-59 program on page 21. The program also demonstrates unique capabilities of the TI-95 such as the use of the windows for prompting, and the merging of alphanumerics and display register values to obtain printout with annotation. A sample printout appears at the right for the same conditions as in the TI-59 example on page 21. The program listing appears on page 23.

User Instructions:

- 1. At program entry the windows above keys F1 through F5 will contain the legends Clr, Out, Add, Lst and Inp. Press F1 (Clr) to initialize. The prompt "Data" will appear in the display. If a printer is connected the heading "Data" wil be printed.
- 2. To enter each input value place the value in the display and press F5 (Inp). If a PC-324 is connected the input value will be printed. The calculator will stop with the number of values entered so far in the display.
- 3. To calculate the statistics and print the output values press F2 (Out). If a printer is connected the heading "Statistics" will be printed followed by the values for the number of input values, the maximum and minimum input values, the mean, the standard deviation, the RMS and the RSS, all with appropriate annotation. If a printer is not connected the output values and the annotation will be flashed in the display. The calculator stops with a zero in the display.
- 4. If you would like a printed heading to indicate that input values are being added to the array press F3 (Add) and the heading "More Data" will be printed. You may add values to the input array by repeating step 2. You may add values without pressing F3 to obtain the heading.
- 5. To obtain a combined printout of all the input data to date press F4 (Lst). The heading "Data" will be printed followed by a list of the input values. If a printer is not installed the input values will be flashed in the display.

Comments on the Program:

Lines 0000 through 0028 define the functions to be associated with keys F1 through F5.

Lines 0036 through 0054 provide initialization, and print the heading "Data".

Elementary Statistics on the TI-95 - (cont)

Lines 0057 through 0068 store the input values in data registers starting at 003.

Lines 0072 through 0081 place the prompt "Use Printer" in the display and the legends "Yes" and "No" below keys F1 and F2. If the answer is yes, flag 1 is set.

Line 0091 - the SBR 0000 re-defines the F1 through F5 functions which had been replaced by the Y/N command at step 0088.

Line 0096 prints the heading "Statistics".

Lines 0110 and 0115 select the one variable statistics option and clear the statistics registers (CS1), and initialize the minimum and maximum values in data registers B (001) and C (002) to the first input value.

Lines 0119 through 0137 retrieve the input values in reverse order, determine the maximum and minimum values of the array, and obtain the sums necessary for statistics calculations. The SG+ command is equivalent to the Σ + command in the TI-59. The STO A at steps 0145/0146 and the 2 ST+ A at steps 0151-0153 restore the location of the last input value into data register A (000). The St+ command is the equivalent of the SUM command in the TI-59.

Lines 0132 through 0202 bring each of the output parameters and the appropriate annotation alphanumeric to the display in order. The SHW 2 and SHW 4 functions are obtained from the SHW option of the STAT key, where SHW 2 retrieves the number of input values, and SHW 4 retrieves the sum of the squares of the input values.

Lines 0205 through 0217 provide the equivalent of the Op 06 function in the TI-59. A test of flag 1 (condition controlled in lines 0072 through 0081 above) is used to select column 16 for the last digit of output value in the display when a printer is not used, or to select column 20 for the last digit of the output value if a printer is used.

Lines 0220 through 0238 print the heading "More Data" in response to function key F3.

Lines 0239 through 0274 print the heading "Data" followed by a list of all the input values in response to function key F4. This portion of the program is a good example of the rule that a new line is started for each label in the program listing.

FROM THE EDITOR - Of course the big news in this issue is the TI-95.

The CI-7 Cassette Interface for use with both the TI-74 and the TI-95 also became available. I haven't had time to even try it. I will report on it next month.

Several correspondents have asked me to comment on the TI-74 versus the TI-95. At this point I see the real advantage of the TI-74 as the BASIC language with a built-in subscript capability. If you do a lot of work with arrays as I do that is important. While the windows and other new features of the TI-95 are attractions, I think that the real advantage is that we have a faster machine which should be able to accept our library of TI-59 programs with a minimum amount of editing. (By the way, have you noticed that 95 is 59 reversed?). For TI-59 programs written with all label addressing the conversion will be particularly easy; even the printout commands (Op 00 through Op 06) can be readily converted as indicated in the example on page 23. Op 07 is a different matter--there does not seem to be any equivalent built-in plot capability in the TI-95, but I may simply have missed it. I didn't find that there was a more direct way of determining if the printer is connected than with a Y/N prompt until today. I also found the CHR IND nnnn or CHR IND X command too late to incorporate it in the program on page 23 to provide sequence numbers for the list option. For TI-59 programs which use absolute addressing the conversion will not be so simple. The problem arises because many of the equivalent TI-95 commands require more program steps; for example, even a Label requires three steps instead of two. At the moment I see no alternative but to enter the TI-59 program in sequence, and then adjust the addresses as required through examination of the branch points.

A card which came with the TI-95 indicates that there will be a <u>free</u> newsletter supporting the device. I sent in the card, but have not yet received any response. The card does not indicate whether or not there will be a program exchange. What I suggest that members who purchase TI-95's do is notify me when they have converted TI-59 programs. I will list them in coming issues in a manner similar to that used to indicate availability of PPX programs for the TI-59. We also need to develop a method for transferring programs on magnetic media. That may seem self-evident once we get the cassette interfaces working; however, experience with the magnetic cards for the TI-59 and with cassette tapes for the Radio Shack Model 100 suggests that there may be some incompatibility problems lurking out there. Time will tell. The other alternative would be to use the TI-695 8K RAM cartridges to exchange data.
