NEWSLETTER OF THE TI PERSONAL PROGRAMMABLE CALCULATOR CLUB P. 0. Box 1421, Largo, FL 34649

Volume 13, Number 3

Third Quarter 1988/1989

The "star" article in this issue is on Frank Ferguson's spreadsheet program for the TI-95. But there is something for almost everyone, with two TI-59 programs, a game for the TI-74, and an expanded list of errata for the CC-40 manuals.

\*\*\*\*\*\*\*\*\*\*\*\*\*\*

I particularly want to call your attention to the discussion of interfacing with peripherals on page 23. Hardly a month goes by without some member writing to describe interface problems or limitations. So, I would like to gather your collective experience and publish it in the next issue.

In the next issue I also hope to cover several of the more extensive programming efforts which have been in progress by our members. One is a set of navigation related programs for the TI-95 which has been put together by Hewlett Ladd and Al Mackenzie. The documentation presently runs to 36 pages. A second is a TI-95 utilities package developed by Robert Prins in machine language.

Enclosed with this issue you will also find a promotion sheet for the BYTE Information Exchange which offers a discount for club members. I don't have the capability to participate so you will have to make your own judgement on whether to join or not.

Finally, I note that some of the mystery and magic of the computer technology may be disappearing. The magazine rack in the Waldenbooks bookstore in Sunshine Mall, Clearwater, Florida displays the following notice: "COMPUTER MAGAZINES HAVE MOVED TO RACK NEXT TO COMICS".

#### TABLE OF CONTENTS

HARDWARE AVAILABILITY	24

Magnetic card service continues to be available for TI-59 programs in this issue, and for the TI-59 programs in earlier issues back to 1983.

Send one dollar per card plus a stamped and self addressed envelope.

This newsletter is not copyrighted and may be reproduced for personal use. When material is used elsewhere we ask as a matter of courtesy that TI PPC Notes be mentioned. The use of material in this newsletter is entirely at the user's risk. No responsibility as to the accuracy and the consequences due to the lack of it will be borne by either the club or the editor.

#### ERRATA

TI-74/PC-324 Calendar - V12N2P6. Wayne Spyker entered this program as listed and found that the printout for a month would not terminate. An example appears at the right, where the printing was terminated by pressing BREAK. The problem was traced to the second statement in line 270. That statement reads IF 1>Q(M) THEN ... where Q(M) is the number of days in the month being printed. The statement should be IF I>Q(M) THEN ... . The error was introduced by a flaw in the printout on the PC-324. Once again, we see that the only sure way to publish programs which will run is to key the program in from the printed page. Unfortunately, that is sometimes not compatible with publication schedules.

System Register Tests and the Unprotect Mode - V13N2P8. Scott Garver and Robert Prins wrote to explain that there is no need to remove system protection in order for system functions to work in programs. They called my attention to the note at the bottom of page A-2 of the TI-95 Programming Guide:

"You can use any of the system functions from the keyboard or from within a program. To store a system function as a program instruction, however, you must remove the system protection before entering the learn mode".

This means that there is no need to use SF 49 to control entry to the system-unprotected mode as described in V13N2P8/9, and the SF 49 and RF 49 commands in the program listings on V13N2P10 are useless. The following listing reflects the removal of those commands. The only other change is that the address for the GTO at line 163 must be changed to 0177.

CHARLIE'S CHALLENGE - Myer Boland provided the first response to Charlie Williamson's challenge to write a program to divide two numbers such that the remainder will be a non-negative number less than the absolute value of the divisor, but without the use of direct comparison logic. Myer's BASIC program which appears at the right obtains the correct answers for the sample problems in V13N2P25.

Editor's Note: The MOD command in line 30 is available with Myer's computer and with my Model 100. It is not available with my Color Computer or with the TI-74 and CC-40. For those machines it is necessary to synthesize a MOD command. That appeared somewhat difficult to do without using comparisons, but then I discovered that all three machines, and the Model 100 as well, mechanize an integer function (INT) which is really a "floor" function such that

INT(2.3) = 2 and INT(-2.3) = -3

For those machines line 30 of Myer's program can then be easily replaced with:

30 X = N - D\*INT(N/D)

So, once again we find that solving programming challenges provides additional insight into how our machines operate. In contrast the integer function of programable calculators such as the TI-59, TI-95, HP-11 and fx-7000G return -2 for an input of -2.3. That result can be obtained on the Model 100 with the FIX function.

GRA LISTINGS - The abstracts for three additional documents offered by Government Reports Announcements in 1988 are:

Hittman Associates, Inc., Columbia, MD.
Selected Hand-Held Calculator Codes for the Evaluation of the Cumulative Hydrologic Impacts of Mining,
R. Sandberg, R. B. Scheibach, D. Koch, and T. A.
Prickett. Sep 82, 298p OSM/TR-8a/3
Portions of this document are not fully legible. Sponsored by Office of Surface Mining Reclamation and Enforcement (DI), Washington, DC.

The objectives of the investigation were: to present a selected group of analytical models that will enable quick evaluation of both individual and cumulative impacts of surface mining on water resources; to consider the needs of the Office of Surface Mining relative to the capabilities of presently available programmable hand-held calculators; to describe techniques that fill the gap that now exists between ordinary paper-and-pencil evaluations and full-sized digital computer evaluations; to allow quick evaluation of permit applications without the need for complicated time-consuming computer analysis; to design calculator programs for the needs Office of Surface Mining (OSM), Region V. They are, however, applicable to hydrologic problems in other areas of the United States as well, since the basic hydrologic theories used are not dependent upon site-specific conditions.

Sur l'Usage des Petits Calculateurs de Poche Comme Calculateurs de tir pour les Canons et les Obusiers (Use of Pocket Calculators When Firing Guns and Howitzers) (Verwendung von Taschenrechnern Beim Schlessen mit Geschuetzen und Haubitzen).

A. Carriere. 2 Sep 85, 47p ISL-N-610/85 Text in French; summary in German and English. Sponsored by Direction des Recherches, Etudes et Techniques, Paris (France). Centre de Documentation de l'Armement.

The possible fields of application are described in the report for programmable pocket calculators during the firing of howitzers. The simple programs lend themselves very well to flight path calculations in view of the adjustment of these artiflery weapons.

AN UNUSUAL TI-59 MALFUNCTION - P. Hanson. In the past few months I found two TI-59's which operated satisfactorily with the battery installed but which would exhibit intermittent problems when mounted on a PC-100. In each case I could induce a loss of power by twisting the calculator on its mount on the printer. Even the twist induced by normal keystroking could cause the problem. The source of the problem was traced to the 22 uf capacitor C7, the small red capacitor mounted near the negative battery contact of the calculator. In the defective calculators the capacitor was located such that when the contact was depressed it touched the body of the capacitor. With each calculator I could see evidence of repeated scraping of the edge of the contact against the capacitor. The solution is to move the body of the capacitor. Since the problem did not occur with the battery installed it seems likely that the PC-100 mount depresses the battery contacts further than the battery.

## DIFFERENT PRINT AND DISPLAY FOR SOME TI-74/PC-324 CHARACTERS

In line 355 of the taper bore check portion of the Menu and Module program on V13N2P21 Don Laughery wanted to use the right arrow (ASCII 126, CTL 4) in the prompts to the user. To his surprise he found that while the code displays as a right arrow, it prints as a tilde ( $\sim$ ). He asked if I was aware of other situations such as this. While working on another problem I stumbled on the paragraph at the bottom of page 3-22 of the TI-74 Programming Reference Guide which indicates that there are four ASCII codes for which the PC-324 printout differs from the TI-74 display:

ASCII	Code	Keystrokes	Display	Printout
92		CTL /	¥	\
124		CTL 1	1	!
126		CTL 4	<b>→</b>	~
127			<b>←</b>	space

SPREADSHEET FOR THE TI-95 - Frank Ferguson. The next four pages provide the documentation for a clever program which operates like a limited range spreadsheet. The program accepts input data into one or two columns, and then provides up to four output columns using functions of the input data which are mechanized through a manipulator program entered by the user. The program illustrates the saving and recalling of data files under program control. The input column entries are stored starting at data register 050.

One idiosyncrasy not mentioned in the instructions: If you call an output column (C1 through C4) at step 3.6 and a corresponding program is not in place in the manipulator program then the error flag will be set and the display will read "LABEL NOT FOUND". You will have to press CLEAR to return to program control.

#### 1.0 INTRODUCTION

The SPREAD SHEET program is designed for applications wherein 1 or 2 columns of data can be manipulated or combined for various reasons. The user enters the data and the program will generate an output data table consisting up to 4 columns. Each column of the output data is a function of the input data determined by a manipulator program written by the user.

#### 2.0 RUNNING THE PROGRAM

The SPREAD SHEET program must be stored in the memory file or an 8k RAM cartridge, under the file name SPD. Make sure that the content of program memory is saved because you will be using it to write the manipulator program.

- 2.1 Now begin the program, select (SPD) form memory file or 8k RAM.
- 2.2 The program displays a menu to let you choose the source of data.

SPREAD SHEE	T
NEW OLD	ESC

(IRT)

To enter NEW data from the keyboard.

(OLD)

If you have previously saved data in program file or \$k RAM, OLD allows you

to retrieve it.

(BSC)

Exit the program. See step 4.0

2.3 Select (NEW) to begin entering data.

The program displays:

	No o	f data	col.	
CS1	CS2			ESC

**(CL1)** 

Lets you enter one column of data.

(CL2)

Lets you enter two columns of data.

(ESC)

Exits the program. See step 4.0

2.4 Select (CL2) to enter two columns of data labeled A and B.

The program will respond by asking for the number of data in a single column.

2.5 Enter 5, then press (GO>.

The program will briefly display "ENTER LIST A" and then will prompt for the data with "n=?" .

2.6 Entering data.

Start with data list A enter 3 press (GO), enter 7 press (GO) and so on. When all data in list A has been entered the program will briefly display "ENTER LIST B". Next, proceed as you did for list A to enter List B.

2.7 Input data.

LIST B
20
13
15
•
3

2.8 After all data has been entered the program will display:

	FIIF	DATA	. 7
	1166	UNIC	
VES	MO		- 1

(YES>

Allows you to save data in memory file or

Sk RAM.

**(NO)** 

Continues to the DATA TABLE. The data will be lost when you exit the program

2.9 Press (YES) to save data as a memory file.

The program briefly displays "Data Hame ?" then will prompt you for the name of the data. (The required "+" is provided for you.)

+	ALPHA
60	

Note: The calculator is already in alpha mode. DO NOT press ALPHA to enter name.

II

فا

S

2.10 Enter DT then press (GO). This will save data as +DT.

The program will prompt you to "Select File" HEM or RAM.

	Sele	ct files	
MEM	RAM		RPT

Will save data in memory file.

(RAN)

Will save data in the 8k RAM. If the 8k RAM is not installed the Calculator vill display error message "INVALID DIR/FILE" and the data will be lost.

(RPT)

Returns to step 2.8 to repeat filing process if desired.

2.11 Select (MEN)

The program will briefly display "FILE +DT SAVED" and continue to "DATA TABLE"

(C1) thru (C4)

Allows you to view the data table.

(ESC)

Exits program. See step 4.0

3. HANIPULATOR PROGRAM

The Munipulator Program is to be entered into the "Program Memory". It can be entered at this point in the program or before you begin running SPREAD SHEET.

- 3.1 Press LEARN. To put calculator in learn mode.
- 3.2 Press (ist). See "Programming Guide" if you are not familiar with using the program memory.

Each column of the data table calls a subroutine in program memory. Column C1 calls LBL C1, column C2 calls LBL C2 and so on.

3.3 Now write Manipulator Program as follows:

LBL C1 RCL A \* RCL B = RTM

LBL C2 RCL A / RCL B = RTM

LBL C3 RCL A - RCL B = RTM

LBL C4 RCL A + RCL B = RTN

3.4 Press LEARN to leave learn mode.

3.5 Press OLD to return to "DATA TABLE"

The program should display the following:

	DAT	A TA	BLE	
CI	C2	C3	C4	ESC

3.6 Now press (C1) to display column 1 of the data table.

The program will display the product of data A and data B as follows:

(	<b>.</b> 0.	L with	1
(	1	)	60.00
(	2	)	91.00
(	3	)	165.00
(	4	)	45.00
(	5	)	3.00
m	m		

The number in parenthesis is the row number of each column.

3.7 To see the input data A in the parenthesis go to learn mode and insert STO G after RCL A in subroutine LBL C1.

LBL C1 RCL A STO G \* RCL B = RTN

- 3.8 Return to data table as in step 3.4 and 3.5.
- 3.9 Press (C1). The program should display as follows:

(	20]	l con	1	
(	3	)		60.00
(	7	)		91.00
(	11	( )		165.0
ŧ	5	)		45.00
(	1	)		3.00
-	m			

The number in parenthesis resides in register G. You can store any number in G as long as it done in the Manipulator Program.

3.9 Continue with columns (C2) thru (C4).

NOTES

급

To temporarily stop the display from changing press and hold any key except BRK until you want the listing to continue.

#### 4.6 QUITTING SPREAD SHEET

After you have finished using SPREAD SHEET you have the option to delete any data file you wish.

4.1 Press (ESC). This will return to the beginning of SPREAD SHEET. See step 2.2.

Now you can either enter new or old data and run the program again, or escape from the program.

#### 4.2 Press (ESC) again

At this point the program will ask you Delete File ? yes or no. If you choose <TES> the program will ask you to name the file as you did in steps 2.9 and 2.10, when you saved a file

If you select (NO) the program will clear the display and reset normal mode.

4.3 Select (NO). This will end the running of the progress.

#### 5.8 RETRIEVING OLD DATA

At this point you should have the input data that you saved in memory as +DT and the manipulator program stored in Program Memory.

Tou may choose to save the Hamipulator Program for later use under any name you desire.

5.1 Repeat step 2.1 and 2.2 but this time select CLD.

The program briefly displays "DATA HAME" then prompts you for the name of the data.

5.2 Enter DT then press (GO).

The program will prompt you to "Select File" MEM or RAM.

5.3 Select (MEM).

The program will briefly display "FILE +DT READ" and continue to "DATA TABLE".

Now you are ready to use the previously entered data for output data columns.

#### 6.0 CONCLUSION

If you wish to use a previously written Hanipulator Program, it must be stored in "Program Hemory" before you began running SPREAD SHEET.

MORE PPX PROGRAMS - A. E. Mackenzie (code 7 in our exchange, see V13N1P10) has updated his list of PPX programs. The following list includes six programs not previously listed and other previously listed programs for which there were less than three other sources.

```
198011 - General Annuities
7
    338001 - Roots of a Polynomial (Newton's Method)
    338005 - Quartic, Cubic, Quadratic Solutions
679 338009 - Lin-Bairstow Roots of a Polynomial
    348004 - Adaptive Simpson's Method (Integration)
79
79
    398049 - Rectangular/Spherical Coordinate Conversion
    398050 - Ellipse and Circle Plotter
    398056 - Hermite Polynomials
79Q 398096 - Polar Graphing Program
    398099 - Two Dimensional Vector Computer
    398167 - Vector Addition and Components
47
    398194 - Properties of Circles
    398196 - Addition of Fractions
    668108 - PV-09 Pressure Vessels
7GQ 698006 - Axonometric Projection
79Q 698007 - Isometric Projection
79Q 698008 - Oblique Projection
79K 788015 - Moon Phase for Any Date
    948005 - Almanac Date for Stars
279 948014 - Sunrise/Sunset
```

The PV-09 Pressure Vessels program (PPX 668108) was incorrectly listed on V13N1P6 as 668105. Al also has the Astrology, 59-Fun, 3D Graphics, Mathematics, Programming Aids, Securities, and Printer Utility specialty pakettes.

TI PPC NOTES V13N3P10

THE TI-68 - The "EEs' Tools & Toys" column of the June 1989 issue of IEEE

SPECTRUM included a favorable description of a new programmable calculator, the TI-68. The suggested retail price is \$65.00. Capabilities of the device mentioned in the article include:

- \* 250 functions including 40 complex number functions.
- \* Solves up to five simultaneous equations with real or complex coefficients.
- \* Finds real and complex roots for quadratic, cubic and quartic equations.
- \* 36 memory registers and 440 program steps.
- \* Integration by Simpson's rule.
- \* Display of twelve digits.

Page 99 of the latest Elek-Tek catalog (Volume 18) offers the device for \$42.00 plus \$4.00 for shipping and handling. When I called Elek-Tek I was told that it was not yet in stock. The device was also not available from EduCALC. I called 1-800-TI-CARES on 26 June. I was told that the device was not yet released. It is expected to be available later in the year, perhaps as late as the fourth quarter.

#### PC to TI-74 INTERFACE CABLE

Georges Leonard wrote to call my attention to page 66 of the #44 issue of the EduCALC catalog which contains the entry which appears at the right. I called EduCALC for more details:

- 1. The device is not available now.
- 2. It is manufactured by TI.
- 3. It will both download and upload.

# PC-Interface Cable Brand New Download data from your TI-74 to a TI or IBM-compatible PC—manipulate the data with PC programs, save to hard disc, floppies or printed hardcopies. High-speed parallel transfer through 4' cable; connector is 1.5 × .75 inches. Stock #U-2153 [PC-Interface Cable] \$54.95

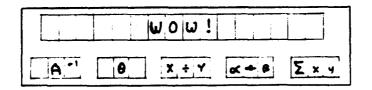

- 4. It is not expected to work with other computers such as the ATARI 1040ST.
- I also called 1-800-TI-CARES. I was told that the device would not be available until the third or fourth quarter.

Editor's Comment: Those who object to the tendency of the computer industry to announce products well in advance of their actual availability will enjoy Kenneth Sheldon's article "Moby Dick 2.1" on page 344 of the July 1989 issue of BYTE. The article starts by speculating:

"As a fan of great literature, I found myself wondering the other day, 'What if novels were published the way software is?' If they were the process might go something like this: Herman Melvile would announce the publication of Moby Dick a year before you could actually buy it. Reviewers would praise it, and several literary magazines would select it as 'Editor's Choice' for best novel of the year--all before it ever appeared on bookstore shelves. ... "

#### A TI-95 PROGRAMMING CHALLENGE FROM SCOTT GARVER

Write a program which will yield the following display:

MORE ON SORTING - P. Hanson. V10N3P13-16 compared five sorting algorithms which were mechanized on the CC-40. Execution times were presented for various numbers of random integers. As a result of correspondence with Robert Prins I re-examined the comparison between the two faster general purpose algorithms, a Shell sort algorithm available as a subroutine of the Statistics cartridge and a heap sort algorithm adapted from a program on page 137 of the September 1980 issue of Creative Computing. For various numbers of random integers the execution times in seconds were:

#### Number of Integers

Method	30	100	300	1000
Shell	13	71	390	1875
Heap	11	52	194	797
Ratio	1.18	1.36	2.01	2.35

where the heap sort becomes relatively more time efficient as the number of integers increases. For integers in reverse order the results were:

Number of Integers

Method	30	100	300	1000
Shell	9	39	157	703
Неар	10	48	180	747
Ratio	0.90	0.81	0.87	0.94

where the Shell sort has a slight advantage, at least for the range tested. Finally, I tested the performance of the two methods where the numbers were already sorted. For the 300 integer case the Shell sort algorithm declares the list to be sorted in 55 seconds. In contrast, the heap sort algorithm does not declare an already sorted list to be sorted until 209 seconds have passed. That is slightly longer than the time to sort 300 random integers or 300 integers in inverse order! I conclude that the execution time of the heap sort is largely independent of the condition of the unsorted list, a characteristic I had not recognized before.

A GAME FOR THE TI-74 - Stephen Gutknecht. In the "Arrow Game" an asterisk (\*) is placed at a random position in the TI-74 display. An arrow, (->) or (<-), appears at either end of the display and begins moving toward the target. The object of the game is to press a key at the exact moment the moving arrow hits the target. Any key except ON, BREAK, RESET, SHIFT, FN or CTL may be used.

At the beginning of the game the player enters a number from zero to 999 in response to the prompt "Random Seed?" to randomize the sequence of target locations. In response to the prompt "Delay for game?" the player enters a number between 0 and 99 to control the speed at which the arrow moves across the display. Higher numbers make the arrow move slower. The first game begins immediately after the delay value is entered. The program stops with either Win!!! or Lose.. at the left end of the display. The remainder of the display shows the cumulative number of wins and games played. To start another game press any key.

To start a new series of games with a different delay press BREAK quickly. To exit the program press and hold BREAK.

#### Program Listing:

#### A Game for the TI-74 - (cont)

Author's Note: The section of the program starting at line 5500 is only for the purpose of making the game faster. This is a replacement for the main loop that starts at line 5200. This will only be called when the game delay is set to zero.

Editor's Notes: This program incorporates several capabilities of the TI-74 not previously used in programs in our newsletter, namely,

- \* Use of fifteen character variable names including the underline which is obtained with CTL 5. (See page 1-4 of the TI-74 Programming Reference Guide.) V10N2P16 contrasted the long variable names available with the TI-74 with other versions of BASIC which permit several letters in the variable name but only use the first two letters to defining variables. With those machines the variable names GAME\_SCORE and GAME\_NUMBER from lines 3500 and 3510 are seen as the same variable GA.
  - \* Use of the KEY subprogram to test whether a key has been pressed. See page 2-60 of the TI-74 Programming Reference Guide.

The very long variable names including the underline were apparently selected for compatibility with program development on another machine; for example, a portion of the program listing submitted by Mr. Gutknecht actually looked like

```
"Arrow game"

```

It occurred to me that the time for a member to enter the program in his TI-74 could be reduced and the amount of memory useage could be reduced by shortening the variable names. For example, "game\_delay" was replaced by "GD", "target\_location" was replaced by "TL", etc. The program which resulted appears on the next page.

#### DETERMINING MEMORY USEAGE - P. Hanson and Douglas Elliot

A FRE(1) command had indicated that Mr. Gutknecht's program on page 12 used 1103 bytes. A FRE(1) after the modification to use shorter variable names indicated that the number of bytes used had actually increased to 1150 bytes. The increase was due my failure to delete the unused variable names from the system. I looked for a "CALL CLEANUP" capability such as that which was available with the CC-40. When I failed to find an equivalent capability for the TI-74 I saved the program to magnetic tape, pressed NEW ALL, and reloaded to program from tape. A FRE(1) now indicated that the condensed program on page 13 used 990 bytes.

In a conversation with Douglas Elliot I commented that there were several useful CC-40 capabilities which had not been provided with the TI-74. I mentioned the CHAR command in which the user could define up to seven special display characters and the the CALL CLEANUP capability. Douglas noted that the equivalent of the CALL CLEANUP could be obtained on the TI-74 by the SAVE command, where page 2-113 of the TI-74 Programming Reference Guide states that "Before storing the program, SAVE removes any variables from the system that are not used in the program. He also noted that it was not necessary to actually save the program. A user can simply enter the command SAVE "1" in the display, press ENTER, and ignore the error message "E0 I/O error 31 "1" which appears.

#### RECENT TI-95 PRICES

Page 35 EduCALC Catalog #44: Order a TI-95 for \$89.95 plus \$1.00 for shipping and handling and you may order a Mathematics or Statistics cartridge for \$5.00 more. Additional cartridges are #39.95 each. Call 1-800-633-2252, ext 353 for credit card orders.

Page 99 of Volume 18 of the Elek-Tek catalog offers a TI-95 for \$75.00 plus \$4.00 for shipping and handling. Call 1-800-621-1269 for credit card orders.

Page 50 of the August 1989 DAMARK International catalog: Order a TI-95 for \$79.00 plus \$6.00 for shipping and handling and get the Mathematics and Statistics cartridges at no extra charge. Call 1-800-729-9000 for credit card orders. Ask for Item No. B-447-122359.

DAMARK is known for selling factory closeouts, distributor overstocks, discontinued merchandise, etc. The availability of the TI-95 through DAMARK would seem to confirm the feeling that the product line is being discontinued or deemphasized. A call to 1-800-TI-CARES confirms that TI is pursuing no new development in support of the TI-95. They are continuing to support repairs. In contrast, as noted on page 10, they are continuing development of peripherals for the TI-74.

COMMENTS ON THE TI-60 - Gene Friel writes "I recently bought a TI-60 for quick calculations and found that, unlike the TI-55II which I recently sold, RST in the TI-60 goes to step 0 and continues the program. R/S had to be pressed for each loop in the TI-55II. Also, backstepping from step 0 in the TI-60 goes to the end of the program, unlike the TI-55II."

#### DOUBLE EXPONENTIAL EVALUATION OF DATA ON THE TI-59 - M. Bogart

Consider a set of data that might be expected to conform to a function of the type  $Y = aX^bZ^c$ . For the purposes of curve fitting the function can be linearized by taking the logarithm of both sides yielding

ln(Y) = ln(a) + b\*ln(X) + c\*ln(Z)

or

y = A + Bx + Cz

where y = ln(Y), A = ln(a), etc. One then can fit the linearized data in the least squares sense using well known techniques for multiple linear regression with two independent variables. For example, see pages 78-79 of the second edition of Kolb's Curve Fitting for Programmable Calculators or chapter 15 of Spiegel's Theory and Problems of Statistics in the Schaum's Outline Series. A solution for the TI-74 was discussed oon V12N3P19.

The TI-59 program on page 17 not only provides the least squares solution, but also provides for replacement of erroneous entries, evaluation of the resulting function at other points, and for input of user-selected solution constants.

# Double Exponential Evaluation of Data on the TI-59 - (cont)

#### User Instructions

- 1. Press E to initialize by clearing the summation registers.
- 2. Press A to start data entry. See a 1 in the display indicating that the first x value is to be entered.
- 3. Enter the X value and press R/S. See a 2 in the display.
- 4. Enter the Y value and press R/S. See a 3 in the display. Note that in this program the dependent variable is entered before the second independent variable.
- 5. Enter the Z value and press R/S. After a short delay to complete the summations, see a number flashed in the display indicating the number of data points entered, and then see a 1 as a prompt for the X value of the next data point.
- 6. Repeat steps 3 through 5 as required.
- 7, Press B to solve. After about 45 seconds the value for a will appear in the display. Press R/S to see the value for b, and press R/S again to see the value for c. If you press R/S again you will see .1111111111 in the display indicating that the output of the solution is complete.
- 8. To evaluate the function for values of Xi and Zi, enter the value for Xi and press C. The value of ln(Xi) will appear in the display. Enter the value of Zi and press R/S. The value of Yi will appear in the display.
- 9. To enter a set of user selected values for a, b, and c, press D and see 20 in the display. Enter the value for a and press R/S. See 21 in the display. Enter the value for b and press R/S. See 22 in the display. Enter the value for c and press R/S. See a zero in the display. If you want the selected coefficients printed press R/S. To evaluate the function with the selected coefficients go to step 8.
- 10. Printout with annotation is provided if a PC-100 is available. The printout for a sample problem appears at the right. You can avoid stopping for readout in the display by changing the R/S instructions to Nop's at steps 169 and 178.
- 11. Removal of incorrectly entered points. If you detect the incorrect entry immediately after the completion of the entry with the program ready to accept the next point as at step 3, you can remove the bad point from the summation by pressing 2nd A'. Then press A to resume data entry. An example appears after the third entry in the printout at the right.
- If you do not detect the incorrect entry until after another data point has been entered you will have to re-enter the bad point, press 2nd A' two times (first to remove the bad point just entered, and then to remove the bad point previously entered). An example appears in the printout where the sixth point was entered to permit correction for the bad entry at point 4.

DOUBLE EXPONENTIAL EVALUATION OF DATA ON THE TI-74 - P. Hanson. V12N3P19 showed the ease with which the program for linear regression with user defined functions from V12N1P14 could be modified to solve linear regression problems with two independent variables W and X. Some additional changes to the program are needed to permit the solution of double exponential problems. In addition, I changed the independent variables from W and X to X and Z for consistency with Marcel's TI-59 program on pages 15-17. The resulting changes relative to the listing on V12N1P14 are:

- 1. Add Z(50) in line 100.
- 2. Change "Pairs" to "Points" in the prompt in line 130.
- 3. Change the comma between A\$ and X(I) to a semicolon in line 160, and change the comma between A\$ and Y(I) to a semicolon in line 180.
- 4. Add lines 181 and 183:

181 
$$A$ = "Z"&STR$(I)&" = ":input A$; Z(I)$$

183 IF PN<>0 THEN PRINT #PN,A\$; Z(I)

5. Change lines 310 and 560 to permit modification of the dependent variable in the user defined functions:

310 
$$B(I)=B(I)+F(I)*F(0):NEXT I$$

560 D = F(0) - YF

A complete set of prompts are provided. Steps 800-860 provide the user defined functions for the double exponential evaluation. To obtain a standard linear regression with two variables such as in V12N3P19 the user defined functions should be:

810 F(0) = Y(L)

820 F(1) = 1

820 F(2) = X(L)

830 F(3) = Z(L)

860 RETURN

A printout from the program for the same problem as on page 16 appears at the right. Note that in this mechanization that A1 = ln(a), A2 = b and A2 = c.

The program listing appears on page 19.

# X1 = 21

Y1 = .201064

Z1 = 2

#### MORE ON THE LINEAR/HYPERBOLIC PROGRAM INADEQUACY IN THE KOLB BOOK

V13N2P4 reported on a long standing inadequacy with the set of TI-59 programs in the second edition of William Kolb's Curve Fitting for Programmable Calculators. Marcel Bogart reports that the third edition of the book, available from EduCALC as stock number M-135 for \$13.95, does NOT have the suggested corrections in place.

HP-35 WANTED - William West, 731 Monroe Street, Apt. 303, Rockville MD 20850 .

#### MAILBAG

"The programming idea in 'Menu and Module' in V13N2P19 was one of the more useful I have seen in a long time. Thanks. ... The approach helped me put about a dozen subroutines together. ... "V.C.

Subscribers to TI's Programmable Calculator News will remember that a similar concept was described on page 3 of the Volume 2, Number 1 issue of that newsletter. I should also give credit to member James Nugent who submitted a menu-driven system in mid-1988.

"I wish to express a belated but sincere thank you for the very personal way you handled my initial contact with you and your organization. Your attention to my individual needs and wants was a warm surprise! B.R.

We would like to believe that the "personal" response is what distinguishes our club and newsletter. We also try to encourage the establishment of networks of club members who share specific interests. As an example, over the past six months there has been a lively correspondence between Carl Rabe, Larry Leeds, Peter Messer and Don Laughery on the smallest circle problem.

#### ALTERING THE UNITS OF POLYNOMIAL CONSTANTS ON THE TI-59 - M. Bogart.

The constants in many empirical engineering equations are a function of the units used for the independent and dependent variables. This program will convert the constants from one set of units to another for polynomials up to degree three in the following manner:

Given that  $Y = A + Bx + Cx^2 + Dx^3$  for one set of units.

Then the problem is to find another set of coefficients such that

$$Y' = XY = A' + B'x' + C'(x')^2 + D'(x')^3$$

when  $x = \infty x' + 6$  defines a linear relationship between the independent variables and % is the conversion factor which changes the units of the dependent variable from the first system of units to the second.

#### User Instructions:

- 1. Press A to initialize and see a 1 in the display.
- 2. Enter the coefficients of the polynomial to be converted (A to D):
  - a. Enter the value for A and press R/S. See a 2 in the display.
  - b. Enter the value for B and press R/S. See a 3 in the display.
  - c. Enter the value for C and press R/S. See a 4 in the display.
  - d. Enter the value for D and press R/S. See a 5 in the display.
- 3. Enter the coefficients which define the relationship between the dependent variables:
  - a. Enter the value for  $\infty$  and press R/S. See a 6 in the display.
  - b. Enter the value for & and press R/S. See a 7 in the display.
- 4. Enter the ratio of the dependent variables (%) and press R/S.

  See .111111111 in the display indicating that the input is complete.
  - 5. Press B to calculate and display the coefficients of the converted equation. After about seven seconds the coefficient A' will appear in the display. Press R/S three more times to display the remaining coefficients of the converted equations. Pressing D a fourth time will yield .2222222222 in the display indicating that all of the converted coefficients have been displayed.
  - 6. To calculate using the converted equation enter the independent variable and press C. After about three seconds the dependent variable will appear in the display. If you press R/S again .3333333333 will appear in the display.
  - 7. The program as written is for use without a printer. To print the input values insert a PRT command after the ST\* 09 command at steps 151/152. To print the output coefficients change the R/S at step 129 to PRT.

# Altering the units of Polynomial Constants on the TI-59 - (cont)

8. A sample problem will demonstrate a change from °F to °C for the independent variable and a change from BTU/1b to joules/gram for the dependent variable for a third degree polynomial relating enthalpy of pure liquid ammonia (heat content above 32 °F) in BTU/1b to temperature in °F as derived from US National Bureau of Standards data. The coefficients of the original polynomial are:

$$A = -34.8154$$
  $C = 3.18288e-04$   $D = 1.33145e-06$ 

Since F = 1.8C + 32,  $\alpha = 1.8$  and  $\beta = 32$ , and

1 BTU = 1054.6 joules and 1 lb = 453.6 grams, then

$$1 \frac{\text{BTU}}{1 \text{b}} \times \frac{1054.6 \text{ joules}}{1 \text{ BTU}} \times \frac{1 \text{ lb}}{453.6 \text{ gm}} = 2.326 \text{ joules/gram}$$

Enter the seven values as defined in steps 1 through 4 in the user instructions. Press B and read the following coefficients for the converted equation:

$$A' = 0.0109691034$$
  $C' = 3.3619709e-03$   $B' = 4.609836978$   $D' = 1.8061428e-05$ 

Enter a temperature in degrees C of -67.72, press C and read an enthalpy of -302.358 joules/gram.

Editor's Note: The routine at steps 115 through 126 avoids one of the annoying idiosyncrasies of the TI-59 where a number such as 3.33e-10 will be displayed .0000000003. In essence the routine guarantees that at least eight significant digits of a value will be displayed, but avoids the scientific notation display format if more digits can be displayed in the standard display format.

#### MORE ERRATA

Regression with User Defined Functions - V12N4P12. The original user defined function regression program in V11N4P12

used the linear equation solution from the Mathematics library of the TI-74. V12N1P14 published a modification which did not depend on the Mathematics module. The original program also printed the input data with the input value on one line and annotation on another line. The modification in V12N1P14 also included an attempt to provide input values on the same line as the annotation; however, the modification incorrectly used commas between the annotation string and the input value. The result is that variables which use more than eight spaces will spill over and be printed on the next line. The reduced printouts which follow illustrate the problem, where the first and third columns were printed with semicolons between the annotation string and the value, and the second and fourth columns with commas.

XI = 21 YI = .201064 ZI = 2	X1 = Y1 = Z1 =	21 .201064 2	X1 = 3.141592654 Y1 = 1.23456E+16 Z1 = 2	X1 = 3.141592654 Y1 = 1.23456E+16
. X2 = 40 Y2 = 1.43996 Z2 = 7	X2 = Y2 = Z2 =	40 1.43996 7	X2 =123456 Y2 = .1294567 Z2 = .12345678	Z1 = 2 X2 = .123456 Y2 = .1234567 Z2 = .12345678

So, lines 160 and 180 of the program listing on V12N1P14 should be changed accordingly. That is the same change as in item 3 on page 18 of this issue.

STORAGE LIFE FOR THE RAM CARTRIDGES - Scott Garver found that various information on the external 8K RAM suggests a limited storage life. For example, page 2 of the 8K Constant Memory User's Guide states that the device:

"... ensures that all contents of the cartridge memory are maintained--even when the cartridge is removed from the calculator. An internal battery gives the cartridge a typical service life of three years or more."

Similarly, Page 12 of the TI-74 BASICALC Technical Data Manual states:

"... The cartridge houses a single HM6264 8K CMOS RAM and a 3 volt lithium battery. When the cartridge is separated from the console, the battery powers the RAM, retaining data for as long as five years. ..."

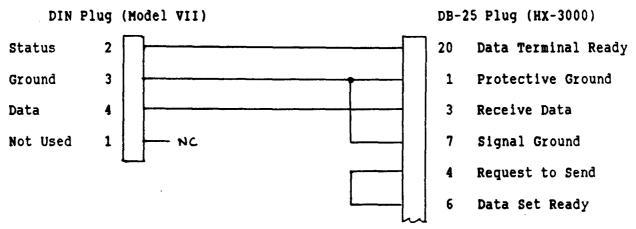

Scott called 1-800-TI-CARES and was informed that the battery in the RAM cartridge is disconnected until it is used the first time. After the first useage the life span is expected to be 3 to 5 years. Obvious additional questions are:

Is the life extended when the RAM is in the calculator?

Does the calculator recharge the RAM?

As of May 1 Scott had not received answers to those questions. He opened a RAM and verified that the battery is is a 3 volt lithium cell (C?2430). Lithium cells are not considered to be rechargeable. The remaining issue is whether pin 24 shown in Table 2 on page 11 of the manual, labeled as "+5 Volt for RAM retention" actually provides the hold-up power when the RAM is installed in the TI-74 or TI-95, thus extending the life of the battery. If so, it would seem that a logical accessory would be a storage device which provides the holdup power for spare RAMs.

MORE ON INTERFACING WITH PERIPHERALS - P. Hanson. Scott Garver also asked if anyone had successfully used the CC-40 hex-bus RS-232 interface with the TI-74 to obtain an 80 column printout capability. I replied that Maurice Swinnen had told me that he had done so. To verify the capability I used the interconnecting cable that Maurice defined in V12N3P23 to connect my TI-74 to the HX-3000. I used a serial cable based on information in the Jan/Feb/Mar 1984 issue of the TISOFT newsletter to connect the HX-3000 to an old Radio Shack Model VII printer. The serial cable was

where V10N1P8 noted that the connection between pins 4 and 6 was not in the TISOFT documentation, but was found by trial and error to be needed to enable printing with the CC-40, the HX-3000 and the Model VII. V10N1P8 also reported that I had to include a programmed delay loop after every print statement to provide a proper printout. I discussed the problem at that time at some length with Maurice. He could only speculate that my HX-3000 had an internal problem. I did not return it for repair. With the TI-74, the HX-3000 and the Model VII I obtained the same printout of a 68 column loan payment schedule that I had used to demonstrate the CC-40 and the HX-3000, but again, only by including the programmed delay loops.

While I was examining CC-40 and TI-74 interface compatibility I also connected the CC-40 to the PC-324 using gender changing pins at the TI-74 end of the interface cable defined by Maurice Swinner in V12N3P23. The PC-324 operated satisfactorily with the CC-40. I jumped to the conclusion that I could use the modified cable withe CI-7 Cassette Interface to provide a long-desired recorder capability for my CC-40. I couldn't make it work, and I don't know why.

In V12N3P23 I reported that I had used Maurice's cable from V12N3P23 to connect the TI-95 to the HX-1000 Printer/Plotter. I successfully demonstrated printing in both the normal and compressed mode. It appeared to set graphics mode (software control code 019) but I could not successfully send the graphics mode commands. I could send software control code 017 and return to the Text mode.

All of this raises some questions on the various uses of peripherals:

- 1. Page 34 of the RS232 Users Manual describes a parallel port cabling option for the HX-3000. My HX-3000 does not have that option installed. Has anyone used an HX-3000 with that option?
- 2. When I opened my HX-3000 I noted an "edge connector" on the board which looked like it would accept an external connector. Has anyone modified his HX-3000 on his own to implement the parallel port option?
- 3. Has anyone successfully used a TI-95 to plot on the HX-1000?
- 4. Has anyone implemented a magnetic recorder capability with the CC-40?

#### EVEN MORE ERRATA

Five Function Curve Fit for the TI-95 - V13N2P16. Don Laughery noted that erratic output formats will occur if the calculator is not in the FIX 9 mode. He suggests and Scott Garver agrees that user's should add a FIX 9 command in the initialization sequence, say between the DEC and CFG commands in the first line of the program listing on V13N2P17.

EXPERIENCE WITH PC-3 PAPER USED WITH THE PC-324 - P. Hanson. In V13N1P3 I reported that I had successfully used Radio Shack's thermal paper for the PC-3 in my PC-324. As I used more of the paper in subsequent months I have observed that catalog number 26-3592B consistently provides better contrast than catalog number 26-3592 or the TI paper. I do not know the difference between the two catalog numbers. In several stores I found the packages with the two catalog numbers intermixed on the store shelf, but there typically is more of the 26-3592 than of the 26-3592B available.

,/

USING X\*X INSTEAD OF X^2 TO INCREASE SPEED - Carl Rabe was investigating ways to speed up his BASIC program for solving the smallest circle problem from V13N2P12. Replacing all of the X^2 functions with X\*X expressions provided a 25 per cent decrease in execution time on his ATARI 1040ST using True BASIC. He asked if we would see a comparable improvement with other machines. I set up routines to time 1000 iterations of either X\*X or X^2 on my TI-74, Model 100, and fx-7000G. The times in seconds for the various machines were:

	TI-74	Model 100	fx-7000G
X*X	17	13	16
x^2	19	28	14

The very limited improvement in the speed of the TI-74 with the X\*X expression seems consistent with the observations in V13N2P27. It seems likely that the TI-74 automatically implements an exponentiation to the second power as a product.

The faster fx-7000G execution time was obtained with the  $x^2$  function. When the  $Ax^2$  function was used the execution time was 76 seconds.

So, for some computers, but not for the TI-74 or CC-40, it does make sense to implement the square function as a product if speed is important.

TI-59 FOR SALE - with a one year old battery pack, charger, ML module, 42 blank magnetic cards, complete manuals, and two Specialty pakettes. One hundred dollars for the lot. Write to Joseph Williford, 895 Rushmeade, Jackson TN 38305. He will include a non-working PC-100C if you want it. Mr. Williford is not a member. You should send a copy of our diagnostics if you want them run before shipment.

PC-100C FOR SALE - It does NOT need the eraser fix for paper to advance properly. \$50.00 plus shipping. Send \$65.00 to TI PPC NOTES. If shipping is less than \$15.00 I will return the remainder.

year my CC-40 developed a

I shipped the defective unit on April

Unfortunately, the repair

Earlier this

problem with the display in which many of the dots would not turn on. I called 1-800-TI-CARES to see if CC-40 repair was still available. told that defective units were replaced rather than repaired.

In mid-May my TI-74 developed an intermittent problem during entry of BASIC statements. The entries into the display would be different

from the keys which had been pressed. Again,  $\bar{I}$  called 1-800-TI-CARES. The repair/replacement cost wgs \$63.00. I shipped the defective unit

EXPANDED ERRATA SHEETS FOR THE CC-40 - I received a new manual with

REPAIR SUPPORT FOR THE CC-40 AND TI-74 - P. Hanson.

17 and had a replacement by April 28. Unfortunately, facility had replaced my 18K CC-40 with an 8K unit.

repair facility and had an 18K unit in hand by May 8.

on May 11 and had a replacement in hand on May 25.

replacement cost was \$66.50 .

Texas Instruments Compact Computer 40 User's Guide

Caution: Read the information on static electricity on page 1-4 before working with your computer.

The following notes provide additional information about using and programming your Texas Instruments Compact Computer 40.

several years ago.

The optional AC adapter referred to is the Texas Instruments model AC9201; use only the AC9201 with your CC-40.

reproduced the three pages below.

**Page 5-34** 

Add the following sentence to the end of the third paragraph

I/O error-type 255 is returned as 0.

The following paragraph provides more information on GETMEM.

program execution by a call to RELMEM. Any of the following The memory reserved by GETMEM can be released during actions cause the reserved memory to be released.

Editing the program or subprogram.

•

- Entering a NEW, OLD, RENUMBER, RUN, SAVE, VERIFY command.
- Listing the program to a peripheral device.
- Calling the ADDMEM or CLEANUP subprogram.
- Turning the system off or pressing the reset key.

**Page 5-48** 

The example at line 290 should be as shown below.

290 IF A\$ = "Y" THEN COUNT = COUNT + 1:DISPLAY AT(4), "Enter value: ";:GOTO 400

Page 5-65

The following paragraph provides more information on status

pressed. A value of 1 means a different key was pressed since the last time the keyboard was scanned for input (e.g., since input. Status-variable is used to store a value that represents CALL KEY, KEY\$, INPUT, or ACCEPT was last executed). A When CALL KEY is executed, the keyboard is scanned for the status of the scan. A value of 0 means no key was 1 means the same key was pressed value of

The one I

the replacement CC-40 mentioned The manual seems to be identical to the manual I received The errata sheet is completely different with the exception of the addition to page 1-7 identifying the AC adapter as Both errata sheets are copyrighted in 1983. received originally carries the nomenclature 1055825-1. received this spring carries the nomenclature 10055825-4. benefit of CC-40 owners who do not have the later errata sheet I have

To avoid this problem, use one of the following methods to be sure that the stack pointer does not point to register 9 when a breakpoint is executed.

- Begin the register file stack at register A<sub>16</sub> instead of at register 1.
- If the position of the stack cannot be altered, add PUSH and POP instructions to the code to ensure that the stack does not use register 9 within the section of code being debugged. The added instructions can be removed after the code is debugged.
- Write the assembly language software such that the stack pointer stays on even byte boundaries.

#### Page I-5

The last paragraph should begin as shown below.

Then B can be typed to continue program execution...

#### Page K-6

The fifth error message paragraph should be changed as shown below.

 Invalid character in statement. For example "%","?","[","]","{", etc., are valid only within quoted strings or in an IMAGE or REM statement. The following program segment provides more information on the use of the CALL KEY subprogram. This segment prompts twice for a key to be pressed. To determine that the responses are distinct, the status variable is compared to 1 (S<>1) in lines 520 and 560.

```
500 PRINT "MORE ENTRIES? (Y OR N)"
510 CALL KEY(K,S)
520 IF S<>1 THEN 510
530 IF K = ASC("Y") OR K = ASC("y") THEN 400
540 PRINT "END SESSION? (Y OR N)"
550 CALL KEY(K,S)
560 IF S<>1 THEN 550
570 IF K = ASC("Y") OR K = ASC("y") THEN STOP
```

#### Page 5-133

The example for line 330 should be as follows.

```
330 SUB PAYCHECK(DATE,Q,SSN,PAYRATE,TABLE(,))
```

Marks the beginning of a subprogram. The variables DATE, Q, SSN, PAYRATE, and the array TABLE with two dimensions may be used and/or have their values changed in the subprogram and their corresponding arguments in the calling statement changed. However, if the corresponding argument of DATE, Q, SSN, or PAYRATE is enclosed in parentheses in the CALL statement, the value of that argument cannot be changed. The corresponding array argument of TABLE must be passed by reference in the CALL statement and therefore any of its values can be changed in the subprogram.

#### Page I-4 (Appendix)

In the fifth line from the top, the address is the second breakpoint set, as shown below.

where nnnn is the address of the second breakpoint set.

#### Pages I-3,4

The following problem can occur when a breakpoint is set in assembly language software by either the breakpoint command or the single step command. If the register file stack is at register 9 and a breakpoint is executed, the program counter is destroyed. The most significant byte of the program counter is changed to the least significant byte plus one.

For example, if the breakpoint is set at address 1235<sub>16</sub>, the breakpoint message is 3635 st 09:, where st is the appropriate status register value. The PC command can be used to change the program counter back to the correct address and program execution can continue.
